

## *MarvelClient's five modules for Lotus Notes Client Management work like magic*

### **Analyze – the crystal ball for transparency and insight**

- Automatic collection of comprehensive information about Notes clients
- Analysis of actual state, delta to target state
- Performance measure, e.g. client start time, quality of network connection

### **Migrate – mass changes at the tip of your wand**

- Up to 7,500 changes per second
- For recertification, migration, consolidation
- Deletion of old, outdated links

### **Manage – saving time and money by ensuring persistence**

- Up to 80% less helpdesk calls through standardization & automation
- Automatic client setup
- 365 days consistency vs. just „Day 1“
- Automatic problem solving

### **Realtime – connectivity voodoo**

- Optimal server connectivity by automatically redirecting users (especially travellers) to right servers – supports hibernation
- Differentiation between LAN, WAN, VPN; works on the fly
- Dynamic restriction of database creation or deletion
- Prevention of harmful actions

### **Roaming – just like performing client teleportation**

- Faster client startup and up to 95% less network traffic compared to Notes data directories on network drives
- Self-sufficient notes clients independent of network outages
- Only 2-4 MB needed to roam an entire client configuration from one client to another
- Includes desktop, bookmarks, names, notes.ini, \*.id, Eclipse settings and more

## The *MarvelClient* suite offers three major advantages: *savings, savings, savings!*

- Up to 100% successful initial setups and ongoing client configurations without any end user interaction
- Up to 80% less help desk calls
- Up to 70% shorter projects for migration, consolidation and recertification on clients
- Up to 50% less mail network traffic
- Up to 20% less disk space for mailfiles

**Total cost-of-ownership (TCO) reduction typically results in a return on investment (ROI) of 2 to 6 months.**

### „Can I ...“

- add, move, clear, rename, recolor, remove workspace pages?
- add, position, remove, and control stack order of desktop icons?
- precisely manage local replicas along with replicator page settings?
- add, modify or remove location and connection documents?
- add, change, remove notes.ini entries and ECL settings?
- manage toolbars?
- monitor client configurations, optionally including hardware and software?
- roam an entire client configuration with as little as 2-4 MB?
- speed up recertification, migration and consolidation projects?

**Yes, you can!**
